Raise your hand if...

You've never used source / version control

You've used source control, but not Git

Beginner in Git as an individual (`git add`, `git commit`)

Moderate/Advanced in Git as an individual (`git rebase`)

Beginner in Git as collaborative team (`git push`, `git pull`)

Agenda

1. Questions from last lecture (Procedural Python)
2. Version Control, Git, and GitHub
3. Hands on practice with Git & GitHub for individuals
4. **On separate video capture:** Turning in homework

Questions from last lecture on Procedural Python?

Why use version control?

Compare writing software with writing a manuscript.

Use undo to revert to a previous state

Use track changes when sharing document with advisor

Still, word processors can still be frustrating.

Intelligently combine changes made concurrently

Record reasoning (why? for code, what?) for changes

Efficient use of file storage

Modern version control systems can address all of these.

Stack Overflow Developer Survey 2018

Version Control

All Respondents

Professional Developers

69,808 responses; select all that apply

Git is a de facto standard for VCS

Benefits (+++++)

Performance: operations in Git are optimized and fast

Flexibility: doesn't require use of a particular workflow

Security: protection against untraceable changes

Popularity: employment, available on many platforms

Distributed: can be used offline, no need for server

Downsides (-)

Distributed: not ideal for large files, merging changes

Version control in the cloud, GitHub

A working copy of your repository stored on GitHub's servers connected and accessible via the internet

Others can download and use your code

Online repository is suitable as central repository

Social features, i.e. issue tracker, comments, notifications

Alternatives: Atlassian's BitBucket, GitLab, SourceForge
